1)Open the command prompt and use the ipconfig tool to find your computer's IPv4 address and default gateway, then take a screenshot of the output.

Ans.

2)Use the ping command to check the connectivity between your computer and www.google.com, then note down the average response time shown.

Ans. I used the ping command to check the internet connection between my computer and www.google.com. All 4 packets were successfully received, with 0% packet loss. The average response time was 27 ms. This means my internet connection was working properly.

3)Run the tracert (or traceroute on Linux/Mac) command to www.flipkart.com and list the number of hops it takes to reach the destination.

Ans. I used the tracert command to check the network route from my computer to www.flipkart.com. It showed 12 hops to reach the destination. Each hop represents a router or network device through which the data passes.

4)Use the nslookup tool to find the IP address of www.spotify.com and explain in one line what this tool helps you verify.

Ans. I used the nslookup command to find the IP address of www.spotify.com.

- **IP Address: Write the address shown in your CMD output.**
- **Use: The nslookup tool helps verify whether a website's domain name is correctly connected to its IP address through DNS.**

**5)A friend says they cannot access Zomato’s website from their laptop. Suggest a sequence of three troubleshooting commands (choose from: ping, ipconfig, tracert, nslookup) you would run to diagnose the issue, and briefly state what each command would help you check.

Hint: Think about checking both network connectivity and DNS resolution.**

Ans. **Three troubleshooting commands to check why Zomato is not opening:**

Command	What it checks
1. ipconfig	Checks the laptop's IP address and default gateway.
2. ping www.zomato.com	Checks whether the laptop can connect to Zomato.
3. nslookup www.zomato.com	Checks whether DNS can find Zomato's IP address.
